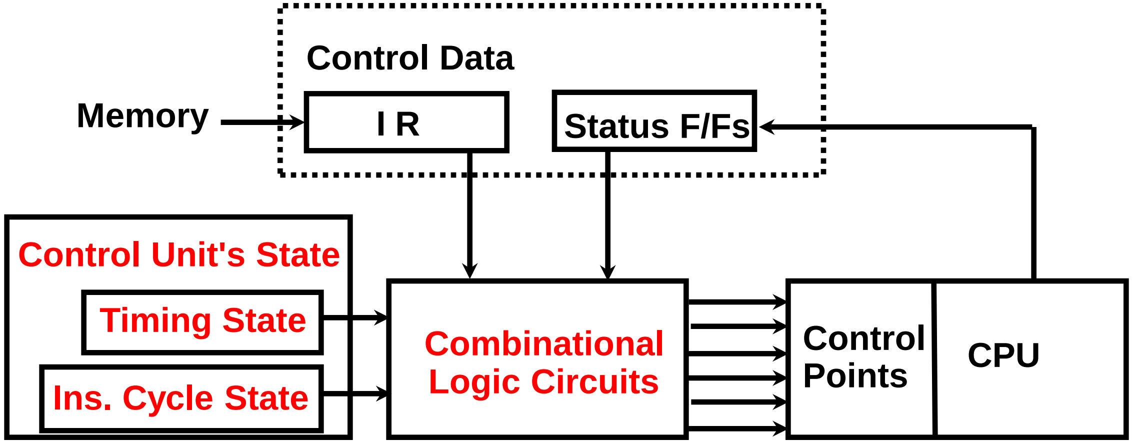
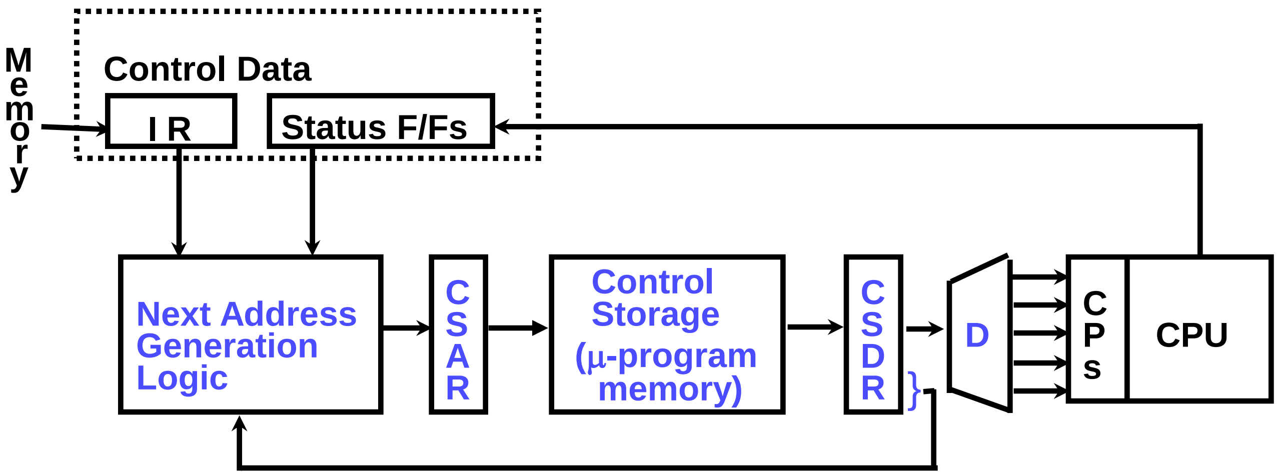
COMPARISON OF CONTROL UNIT IMPLEMENTATIONS

Control Unit Implementation

Combinational Logic Circuits (Hard-wired)



Microprogram



TERMINOLOGY

Microprogram / Microcode (corresponding to one CPU instruction)
- Consists of microinstructions
- Program stored in memory that generates all control signals required to execute the instruction set correctly

Microinstruction
- Contains a control word and a sequencing word
  - Control Word - All control information required for one clock cycle
  - Sequencing Word - Information needed to decide the next microinstruction address

Control Memory (Control Storage: CS)
- Storage for microprogram. Generally ROM

Writeable Control Memory (Writeable Control Storage:WCS)
- CS whose contents can be modified
  - -> microprogram
  - -> Instruction set

Dynamic Microprogramming
- Computer system whose control unit is implemented with a microprogram in WCS
- Microprogram can be changed by a system programmer or a user

TERMINOLOGY

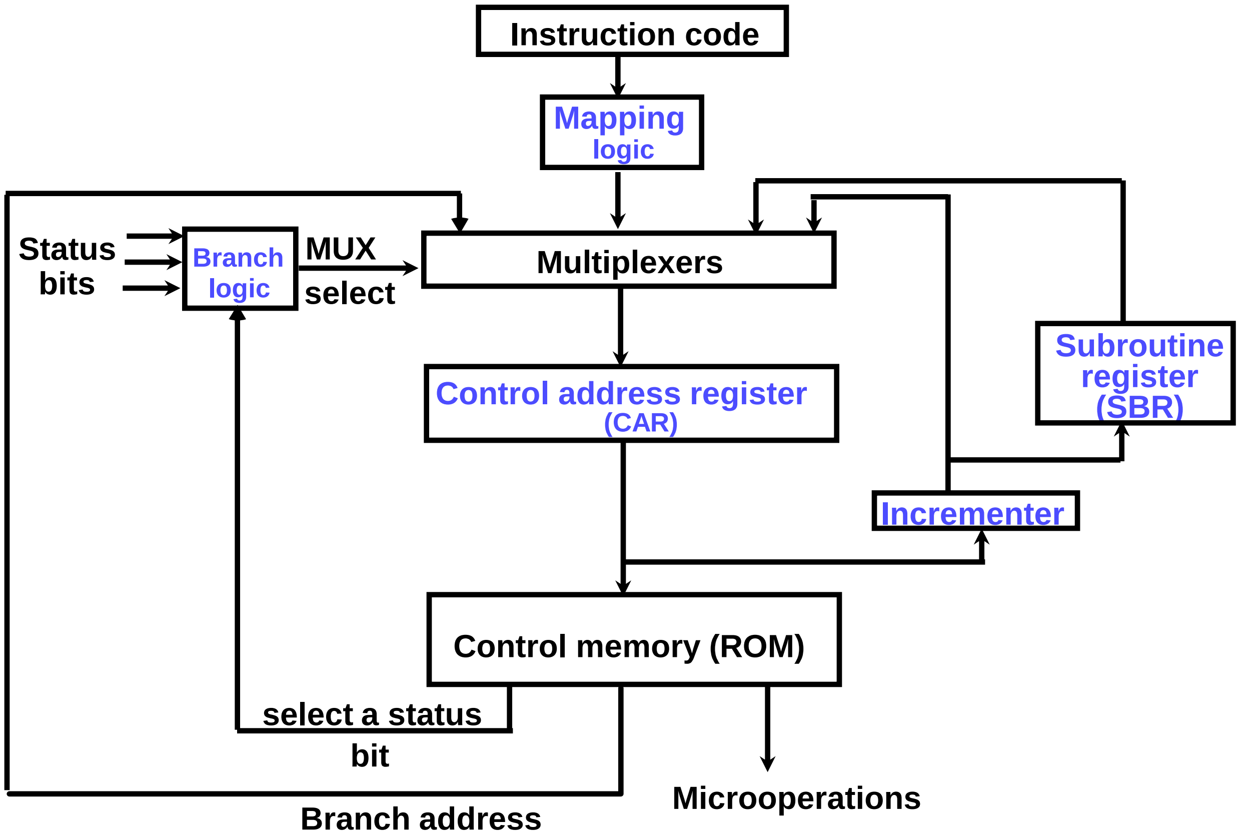
Sequencer (Microprogram Sequencer)

A Microprogram Control Unit that determines the Microinstruction Address to be executed in the next clock cycle

Sequencing Capabilities Required in a Control Storage

- **Incrementing of the control address register**
- **Unconditional and conditional branches**
- **A mapping process from the bits of the machine instruction to an address for control memory**
- **A facility for subroutine call and return**

MICROINSTRUCTION SEQUENCING



CONDITIONAL BRANCH

Conditional Branch

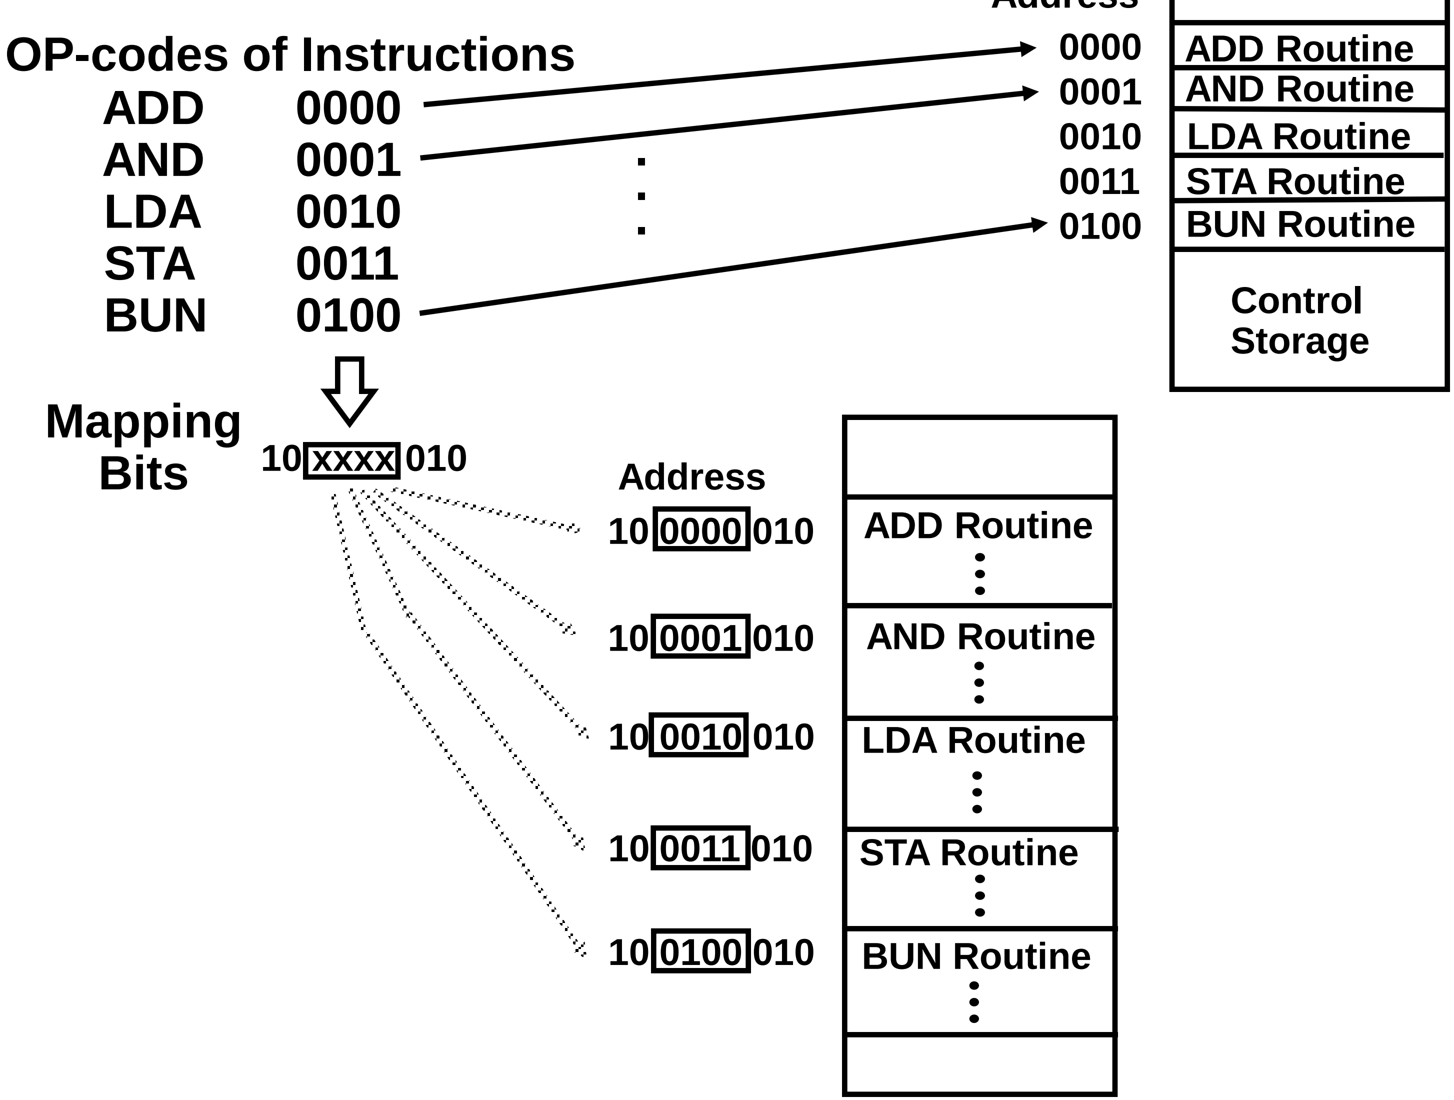
If *Condition* is true, then *Branch* (address from the next address field of the current microinstruction)
else *Fall Through*
Conditions to Test: O(overflow), N(negative), Z(zero), C(carry), etc.

Unconditional Branch

Fixing the value of one status bit at the input of the multiplexer to 1

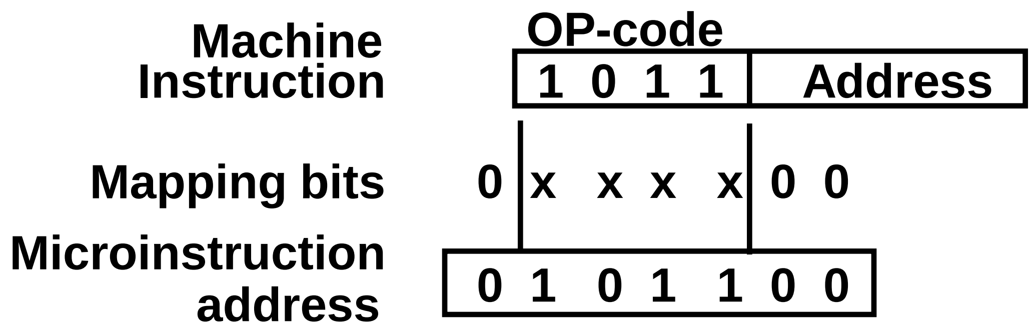
MAPPING OF INSTRUCTIONS

Direct Mapping



MAPPING OF INSTRUCTIONS TO MICROROUTINES

Mapping from the OP-code of an instruction to the address of the Microinstruction which is the starting microinstruction of its execution microprogram



Mapping function implemented by ROM or PLA

SYMBOLIC MICROINSTRUCTIONS

- Symbols are used in microinstructions as in assembly language
- A symbolic microprogram can be translated into its binary equivalent by a microprogram assembler.

Sample Format

five fields: label; micro-ops; CD; BR; AD

Label: may be empty or may specify a symbolic address terminated with a colon

Micro-ops: consists of one, two, or three symbols separated by commas

CD: one of {U, I, S, Z}, where
- U: Unconditional Branch
- I: Indirect address bit
- S: Sign of AC
- Z: Zero value in AC

BR: one of {JMP, CALL, RET, MAP}

AD: one of {Symbolic address, NEXT, empty}

SYMBOLIC MICROPROGRAM - FETCH ROUTINE

During FETCH, Read an instruction from memory and decode the instruction and update PC

Sequence of microoperations in the fetch cycle:

$AR \leftarrow PC$
$DR \leftarrow M[AR], PC \leftarrow PC + 1$
$AR \leftarrow DR(0\text{-}10), CAR(2\text{-}5) \leftarrow DR(11\text{-}14), CAR(0,1,6) \leftarrow 0$

Symbolic microprogram for the fetch cycle:

```
            ORG 64
FETCH:      PCTAR           U   JMP   NEXT
            READ, INCPC     U   JMP   NEXT
            DRTAR           U   MAP
```

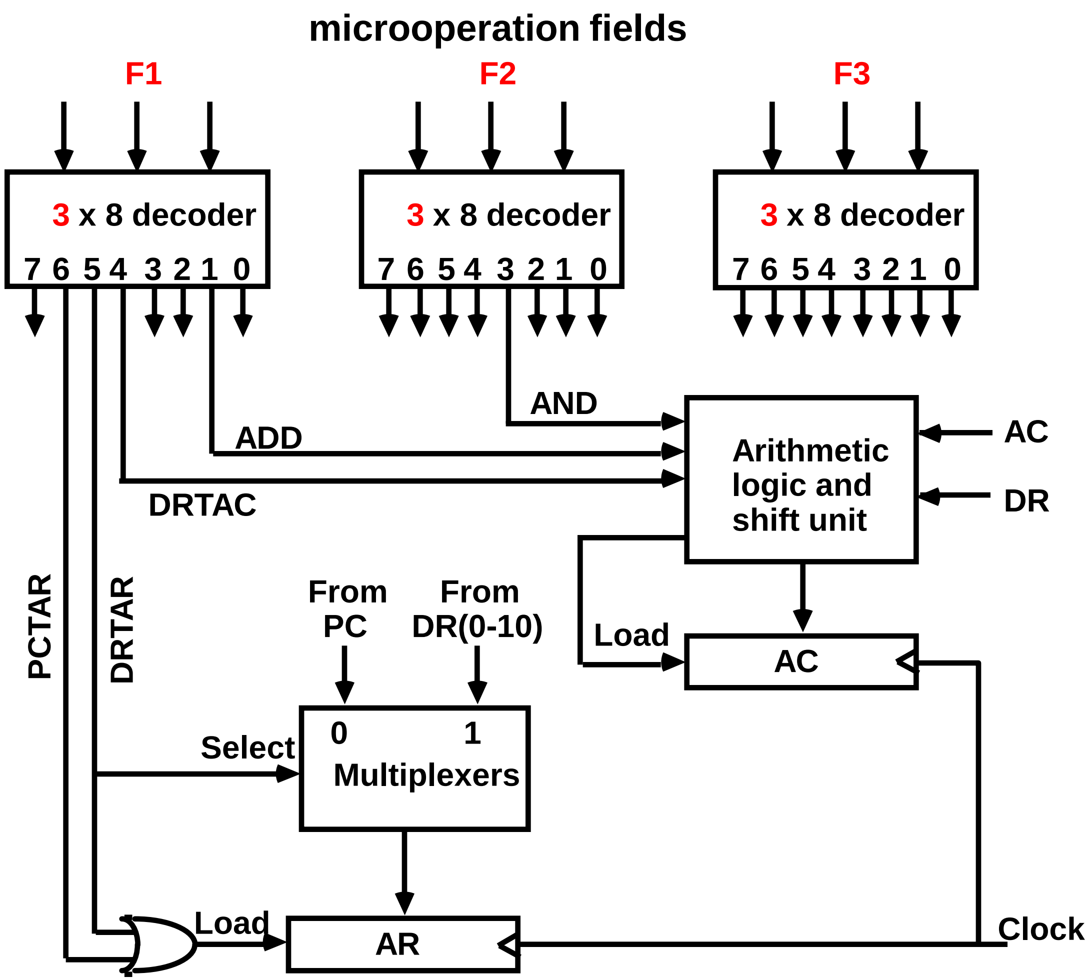
DESIGN OF CONTROL UNIT
- DECODING MICROOPERATIONAL FIELDS-



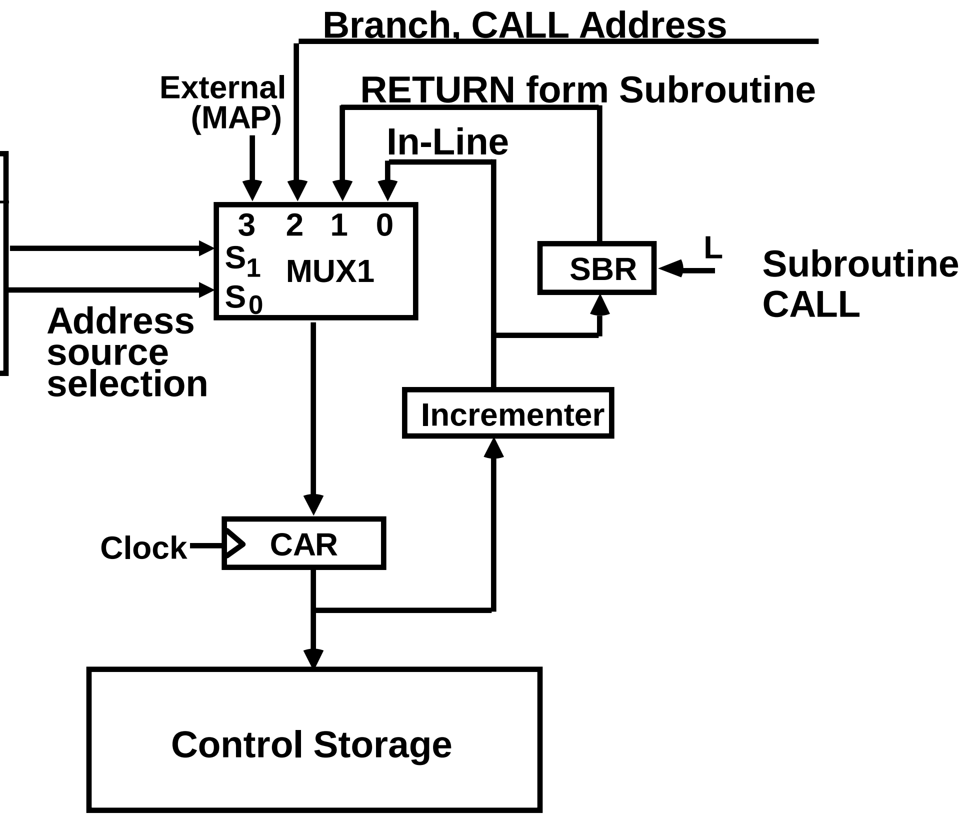
Few functions are shown as outputs of 3 decoders

Note:

Instead of using gates to generate control signals for ADD, AND, and DRTAC these will become now outputs of MUX

MICROPROGRAM SEQUENCER
- NEXT MICROINSTRUCTION ADDRESS LOGIC -

S_1S_0	Address Source
00	CAR + 1, In-Line
01	SBR RETURN
10	CS(AD), Branch or CALL
11	MAP



MUX-1 selects an address from one of four sources and routes it into a CAR

- In-Line Sequencing → CAR + 1
- Branch, Subroutine Call → CS(AD)
- Return from Subroutine → Output of SBR
- New Machine instruction → MAP
